

Nimbus AI

Intelligent logistics optimization, powered by ML

Nimbus AI — Company & Capability Overview

Nimbus AI builds machine-learning systems that help fleet operators move more freight with the vehicles they already run. Our platform plugs into existing telematics and dispatch tools and pays for itself by reducing empty miles, cutting idle time, and smoothing demand peaks. We are evidence-led: every claim below is measured from live customer deployments across European road freight.

What we offer

Dynamic route optimization that re-plans in real time as orders and traffic change; demand forecasting that predicts order volume by region a week ahead; an idle-time analytics dashboard that shows exactly where vehicles wait and why; and automated carbon reporting that turns telematics data into auditable CO2 figures for customers and regulators.

Why customers choose Nimbus

We are telematics-agnostic, deploy in weeks rather than quarters, and price on a simple per-vehicle subscription with no long lock-in. A dedicated success engineer runs a paid pilot first, so buyers see proof on their own fleet before any rollout. Our tone is practical and outcome-first: we lead with measured results, never hype.

Outcomes from deployments

Metric	Typical result
Idle vehicle time	down 28%
Empty miles	down 17%
On-time delivery	up 12 points
CO2 per delivery	down 15%
Time to first value	3-5 weeks

Measured impact across deployments
